

## FOLACOMP PA Underpacking, self-adhesive

### Handling and Storage information

#### DESCRIPTION:

The Folacomp PA is a self-adhesive version of the standard compressible Folacomp underpacking.

The additionally inserted polyester film improves the dimensional stability and increases the service life of the compressible underlay.

The adhesive used is characterised by good adhesion values and high shear strength, which prevents the underpacking from slipping during the printing process.

#### PREPARATION OF THE COATING CYLINDER:

- Remove the old used underpacking from the cylinder while it is still warm.
- The use of a grease-free, fast evaporating cleaning agent such as alcohol should ensure a clean cylinder surface. Please note that cleaning agents with greasing substances reduce the adhesion of the Folacomp underpacking. We do not recommend the use of re-greasing cleaning agents. The use of a grease-free fast evaporating wash like alcohol should provide a clean surface.
- Careful cylinder cleaning creates the best conditions for a good adhesion when applying the self-adhesive Folacomp underlay. This enables it to achieve its full performance range and service life.
- It is recommended to replace the Folacomp PA after 6 months of use.

#### STORAGE:

- Folacomp underpacking should be stored flat in their original packaging in small stacks until they are being used (avoid pressure from above). A dust-free storage is recommended.
- The ideal storage temperature is between 18-22°C with a relative humidity of 50-55%
- Furthermore, the underpacking material should not be stored in the sun or next to heat sources. This leads to an increased ageing process of the material.
- The maximum storage period of 12 months should not be exceeded.
